# BARWAL DAHLIA FARM

## Announcing Our Newest Introduction

### LITTLE BRENDA "BB", Stc. Mimosa Yellow

This little beauty will win for many exhibitors in future years. On Webb's Eastern Review, 1960. 5 x 3 inches. Bush 4 feet.

Roots \$5.00 Net. Plants \$2.50, delivery at our greenhouse only. No Plant Shipments.

We will have on hand also plants of other new introductions and older good varieties. Let us know your needs in this line early.

Grow our other former introductions this year. They are: BARWAL QUEEN, SPORTING LADY, AUNT SARAH, IVORY LASS, LITTLE CHET and HENRY O.

## NOTICE TO OUR CUSTOMERS

**PLEASE ORDER EARLY.** Orders filled as received.

**TERMS:** CASH WITH ORDER. No order less than \$3.00. Postage charges of 35 cents on orders up to \$5.00 and 75 cents on all orders over \$5.00. Customers pay all C.O.D., special delivery and special handling charges.

**ORDERS SHIPPED** from April 1st to June 1st. Very early orders shipped at customer's risk. We have been State Inspected and our plants and bulbs have been found to be disease free. All stock guaranteed to grow and to be in good condition when shipped. If Tubers fail to start within three weeks, replacement will be made if Tuber is returned. Planting instructions with each order.

**PLAN TO VISIT** our garden from Labor Day on. Visitors are always welcome. Do pay us a visit—we know you will enjoy it!

Pepy, carmine and yellow .....	1.00
Rondeur, Min, red with gold base .....	1.00
Rostock, reddish orange .....	1.00

## SUGGESTIONS FOR GROWING PRIZE WINNING DAHLIAS

**CARE OF TUBERS UPON ARRIVAL.** Plant immediately if possible. If not, remove from box carefully being sure you do not break off sprouts or eyes and place tubers on layer of slightly dampened peat moss, saw dust or vermiculite and put in a cool place. Then prepare soil for planting. Spade well to a depth of at least one foot. Broadcast over this about 7 lbs. of 5-10-10 fertilizer or 5 lbs. of bone meal. Rake over lightly, and leave ground in the rough for about 2 weeks until soil is warm enough to plant. We plant about the 15th to 20th of May. Now measure distance between plants and leave 3 feet for large plants and 2 to 2½ feet for pomps and miniatures. Drive in stakes, and dig holes about 5 inches deep. Remove labels from tubers (attach labels to stakes) and plant flat side down, eye up, about 1 inch from stake and cover with 3 inches of soil. Fill in hole gradually as you cultivate throughout season having at least 4 inches above ground level by mid-August when you stop cultivation. When plants have grown about 18 inches high pinch back to 3rd set of leaves, this will give you a stockier plant. As plant grows in height keep it tied to stake. Cultivate at least once a week and after every rain storm. In 1st week of July and mid-August when buds begin to appear give a good dressing of same fertilizer you used when planting. After buds appear — stop all cultivation but keep up the spraying program. **SPRAY YOUR PLANTS** once a week or after every rain even though they look healthy. We use DDT 50% WP and ARAMITE 15% WP. One tablespoonful of each to a gallon of water. This will keep your whole garden and shrubbery practically insect free. For Corn Borer we use DDT dust on a calm dewy morning, dusting plants carefully so that leaf, stem and bud terminals have DDT on them. This is where Corn Borer Moth lays her eggs. June, July, August and September dustings are required.

### NOTICE:

We do not plant until the 15th to 20th of May. Wait until your ground is dry and warm. We will not replace any roots that have rotted on account of being planted too early. If any Tubers do not show signs of growing after being in ground for three weeks return them and we will replace. *Do not condemn small Tubers.* Some of our largest and best varieties make small Tubers.

*If you have any questions or problems during the growing season, drop us a line and we will try to help you out.*

### DIGGING AND STORING OF ROOTS AFTER FROST:

About 3 or 4 days after a black killing frost; select a sunny day. Cut the dahlia stalks off about 5 inches above ground. With a spading fork carefully dig and lift the clumps of roots from the ground being careful not to break or twist the tubers or necks. Take tag from stake and twist around one of the tubers, or write the name on damp tubers with an indelible pencil for future identification. Turn clumps over and allow them to drain for about 4 hours. Pick up and take into storage. Pack into airtight boxes or barrels lined with newspaper. We use boxes and put in a layer of clumps and a good heavy layer of newspaper doing this until the box is filled, then covering over with newspaper. Look at them several times through the Winter. Store in a cool dry place away from frost or heat about 40 degrees. About the middle of April or first of May take out tubers and start to divide them for planting.
